СОШ № 12
Томск, Русия

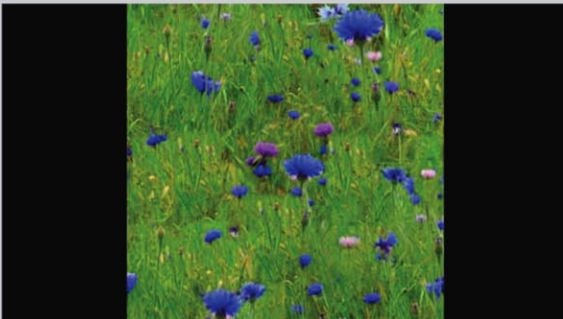

It is the best-known Karst region in Estonia and the biggest in Harjumaa (its total area is 125 hectares). A large region with the total area of 16 hectares is under state protection. That part of the Karst region is also the most interesting one.

The bottom of the grotto is always covered with water. Here is also one Karst bridge and peculiar residual rocks known as "stone mushrooms" in the Karst region.

In the Karst field there are 2 - 3 flood periods per year - early in the spring, in the autumn, and sometimes also during a rainy summer. Ditches have been dug above the secret river to facilitate the drainage of the floodwater.

In Kostivere Karst region alpine meadow grass (*Poa alpina* L.) has been found. This graminaceous plant of arcto-alpine origin is very rare in Estonia, as here is the southernmost border of its area. It is also listed in the Red Book of Estonia.
